I. Anti-DDoS Service Overview

Dear testgjtest user, hello, thank you for using China Telecom Security Company-Yundi Anti-DDoS Service. Your service mode is (Standard Edition DDoS Attack Protection). During the service cycle from May 01, 2026 to May 31, 2026, we provided traffic monitoring services for 1.0721 million IPv4 addresses and 2 IPv6 address segments of your organization. During the monitoring period, the overall inbound traffic peak reached 499.99Gbps, and the overall outbound traffic peak reached 499.88Gbps. We reported 88 traffic anomalies for your organization, initiated 986 protections, and the total protected traffic reached 2375449.10Gb. Please pay close attention to the network protection status at any time. The specific service information is as follows.

1.1 Service Content

Attack Monitoring

IPv4: 1.0721 million ↑

IPv6: 2 segments

Protection and Scrubbing

Authorized Scrubbing

Manual Customer Scrubbing

Automatic Scrubbing

Traffic Analysis

Attack Analysis

Monthly Monitoring Analysis

The current number of IP addresses is too large, please refer to the protected assets below or log in to self-service to view:<https://console.damddos.com>.

1.2 Protected Assets

1.2.1 Protected IP Addresses

序号	防护IP地址	序号	防护IP地址

III. China Telecom Network-wide May Security Posture

Year Month, a total of attacks occurred in the China Telecom backbone network, with a total attack traffic of approximately ten thousand TB, and a monthly maximum attack peak of Gbps. Among them, attacks originating from the international direction accounted for ten thousand TB, attack traffic originating from other domestic operators accounted for ten thousand TB, and attack traffic originating within the China Telecom network accounted for ten thousand TB, .

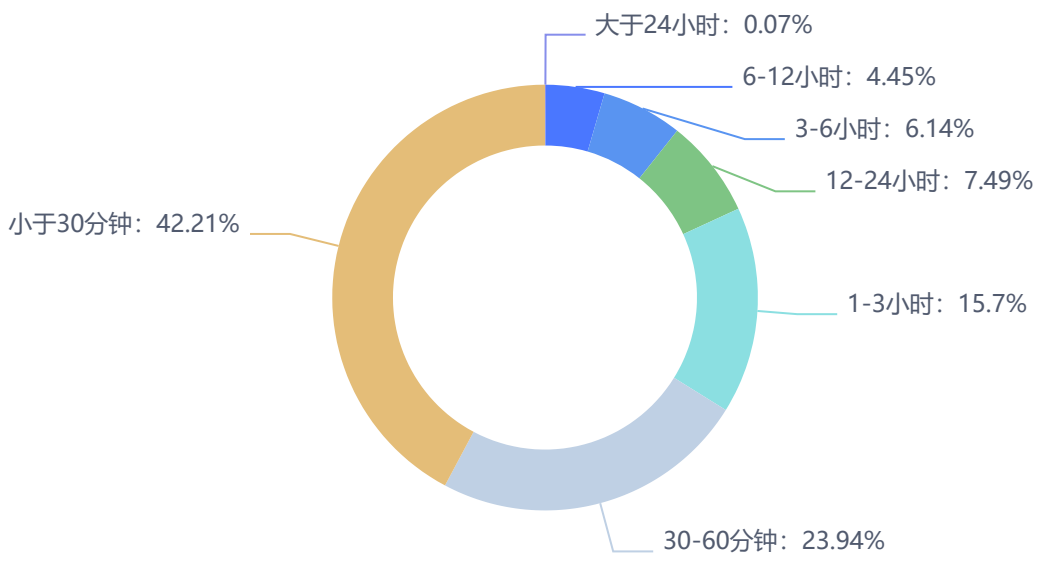

年	月	攻击次数 (万次)	攻击总流量 (万TB)	国际方向 (TB)	国内其他 运营商方向(TB)	电信方向 (TB)	最高攻击峰值 (Gbps)
2026	5	0.31	3.15	4008.12	3318.67	24266.70	1278.96

Peak statistics were conducted on various attack events on the China Telecom backbone network in the month of , and about of the total attacks had a peak value greater than 100Gbps, and the proportion of large-scale attacks compared to last month . As shown below:

[Edit chart](#) [Delete chart](#)

Statistical analysis was conducted on the attack duration of various attack events on the China Telecom backbone network in the month of , and the main attack duration was , accounting for about of the total attacks, and the number of ultra-long attacks exceeding 24 hours was very small.

[Edit chart](#) [Delete chart](#)

Based on the above analysis of the attack situation intelligence, it can be clearly seen that the current DDoS attack types are mainly high-traffic attack methods in the range of , and the attack traffic in this range is launched rapidly, exhausting the protection resources of ordinary anti-DDoS service providers, and after causing an obvious congestion effect on the attack target, it ends quickly. This month's .

IV. Introduction to Cloud Dam Anti-DDoS Service

4.1 Service Products

China Telecom has deeply analyzed the characteristics of DDoS attacks and combined with China Telecom's abundant Internet bandwidth, carrier-grade scrubbing equipment, powerful IT system capabilities, and professional teams, to tailor a carrier-grade DDoS security protection product - "Cloud Dam" for China Telecom's government and enterprise customers. "Cloud Dam" possesses unique industry advantages such as super T-level processing capability, rich and convenient self-service methods, second-level protection effective time, and high-precision full-coverage attack traceability capability. It provides carrier-grade DDoS security protection services for customers, and provides cybersecurity services such as DDoS attack monitoring, attack protection, and analysis and traceability for customers accessing the Internet via the China Telecom network. "Cloud Dam" provides "butler-style" DDoS attack protection solutions for government and enterprise customers, including three functional services: attack monitoring, attack protection, and analysis and traceability.

Attack Monitoring

The attack monitoring service conducts abnormal traffic monitoring on the protected objects according to customer requirements, and simultaneously possesses the monitoring of different application traffic, including http, DNS, video, etc. When abnormal traffic occurs or exceeds pre-set thresholds, the China Telecom management platform will display alarm information, which can proactively alert China Telecom's professional monitoring personnel, and at the same time, according to customer needs, can notify the customer's point of contact via SMS or email.

Attack protection

传统流量清洗服务限于清洗设备部署等问题，多是近目的清洗，面临接入带宽资源消耗问题，而“云堤”提供的流量清洗是突破性的近源清洗，利用电信全网资源在近攻击源处完成流量清洗，解决接入带宽消耗问题。

Analysis and Traceback

Analysis and traceback services refer to analyzing customer service traffic flowing through the China Telecom CHINANET network and DDoS attack traffic targeting customer networks.A) Within the China Telecom network, it provides provincial traffic distribution, or provides more detailed geographical location (such as MAN/IDC) traffic distribution analysis based on customer needs.B) For non-China Telecom networks, it provides traffic distribution differentiated by country or carrier network.

4.2 Service Process

Currently, Cloud Dam Anti-DDoS provides traffic monitoring and scrubbing protection services for testzgjtest customers.

The service process provided by Cloud Dam for testzgjtest customers is as follows:

- After Cloud Dam monitoring detects that the testzgjtest customer is suffering a DDoS attack, it promptly notifies and, upon obtaining authorization, immediately initiates scrubbing protection actions. After the scrubbing actions begin, it confirms the protection effect with the relevant engineers of the testzgjtest customer until the attack ends.
- When the testzgjtest customer discovers a DDoS attack and the business is affected, they can contact Cloud Dam to initiate scrubbing protection by calling 4009259120 (suppression actions can be operated independently via self-service); both parties confirm the protection effect until the attack ends.
- After the attack ends, Cloud Dam provides an attack event analysis and traceback report to the testzgjtest customer within the specified time. The report content covers three major aspects: attack overview, attack analysis, and protection summary.

攻击防护服务流程
